Use Simple Rates in Practical Contexts

Step 6

Elementary (Grades 2–3)

Today I am learning to use simple rates to solve problems in real life.

1. Read the Rate

Read each rate and match it to the correct picture.

a) 2 apples for each child.  ☐

b) 3 cups of juice for every 2 children.  ☐

c) 4 stamps for every 1 envelope.  ☐

d) 5 books for each shelf.  ☐

2. Complete the Tables

Use the rate to complete each table.

a) Rate: 2 pencils for every 1 child.

Number of children	1	2	3	4	5
Number of pencils	2				

b) Rate: 3 cookies for every 2 plates.

Number of plates	2	4	6	8	10
Number of cookies	3				

c) Rate: 4 stickers for every 1 page.

Number of pages	1	2	3	4	5
Number of stickers	4				

3. Practical Problems

Use the given rates to solve each problem.

a) A train travels 60 kilometres every hour.
How far will it travel in:

i) 2 hours? __________ km ii) 3 hours? __________ km
iii) 4 hours? __________ km iv) 5 hours? __________ km

b) A water tap fills a bucket with 6 litres of water every minute.
How much water will it fill in:

i) 2 minutes? __________ L ii) 5 minutes? __________ L
iii) 7 minutes? __________ L iv) 10 minutes? __________ L

c) A printer prints 15 pages every minute.
How many pages will it print in:

i) 2 minutes? __________ pages ii) 3 minutes? __________ pages
iii) 6 minutes? __________ pages iv) 8 minutes? __________ pages

4. Find the Missing Rate

Look at the tables. Write the rate (how many for each) and answer the questions.

a)

Number of toy cars	1	2	3	4	5
Total wheels	4	8	12	16	20

Rate: ________ wheels for every 1 toy car.

How many wheels for 7 toy cars? __________

b)

Number of people	1	2	3	4	5
Total slices of pizza	2	4	6	8	10

Rate: ________ slices for every 1 person.

How many slices for 6 people? __________

c)

Number of packets	1	2	3	4	5
Total paper clips	10	20	30	40	50

Rate: ________ paper clips for every 1 packet.

How many paper clips for 7 packets? __________

5. Real-Life Scenarios

Read each situation. Determine the rate and use it to answer the question.

a) A baker makes 18 muffins in 3 minutes.
What is the rate of muffins per minute?

Rate: ______________________________

How many muffins will the baker make in 8 minutes? __________

b) A farmer plants 12 carrot seeds in 4 rows.
What is the rate of seeds per row?

Rate: ______________________________

If he plants 6 rows, how many seeds will he plant? __________

c) A shop sells 5 ice creams for $15.
What is the rate in dollars per ice cream?

Rate: ______________________________

If I buy 7 ice creams, how much will I pay? $ __________

6. Think and Extend

Use simple rates to solve these challenges.

a) A bus leaves the station every 20 minutes.
If the first bus leaves at 9:00 a.m., what time will the 5th bus leave?

Answer: __________

b) A paint mixer adds 250 ml of paint every 30 seconds.
How much paint will it add in 3 minutes?

Answer: __________ ml

c) A cyclist travels 18 km every 30 minutes.
How far will the cyclist travel in 2 hours and 30 minutes?

Answer: __________ km

I can...

- ☐ read simple rates.
- ☐ use tables to show rates.
- ☐ solve practical problems using simple rates.
- ☐ explain my thinking.

Chance Words

- **rate** – how many of one thing for each of another
- **per** – for each (e.g. 5 apples per child)
- **every** – used with a number to show a repeated amount
- **each** – one of a group

Great job!
You are using rates to solve problems in real life!
