

Record Simple Chance Outcomes from Repeated Trials

Today I am learning to record simple chance outcomes from repeated trials.

1. Predict and Try

Before you start, which outcome do you think will happen more?

Flip a coin 10 times. Record each result.

Trial	Outcome (H or T)
1	
2	
3	
4	
5	
6	
7	
8	
9	
10	

2. Tally the Results

Use tally marks to show how many times each outcome happened.

Outcome	Tally	Total
Heads (H)		
Tails (T)		

3. Spin and Record

Spin 12 times. Record each result.

Colour	Tally	Total
Red		
Blue		
Yellow		

4. Roll the Dice

Roll a die 15 times.

Record how many times each number appears.

Number	Tally	Total
1		
2		
3		
4		
5		
6		

5. Compare the Outcomes

- Which coin outcome happened more often? _____
- Which spinner colour happened the most? _____
- Which spinner colour happened the least? _____
- Did all outcomes happen the same number of times?

6. Look at the Data

- If red was spun 6 times, blue 4 times, and yellow 2 times, which happened most often?
☐ Red ☐ Blue ☐ Yellow
- If a die showed 3 only one time, was 3 a common outcome or a less common outcome?
☐ Common outcome ☐ Less common outcome
- Why do repeated trials help us learn about chance?

7. My Own Trial

Choose a chance activity (coin, spinner, or coloured counters from a bag).

My chance activity: _____

What I will record: _____

Outcome	Tally	Total

What I noticed:

8. Think and Reflect

- What does tally mean?

- Why might results be different each time we repeat a chance activity?

- What did you notice when we recorded the outcomes?

I can...

- ☐ record outcomes from chance activities
- ☐ use tally marks and totals
- ☐ compare which outcome happened more or less often
- ☐ talk about what I notice in repeated trials

Chance Words

Great job!

You are learning to observe and record chance outcomes!
