

Use Simple Fraction Ideas to Describe Chance

Today I am learning to use simple fraction ideas to describe chance.

Step 5

Early Elementary
(Grades 1–2)

1. Colour and Write the Fraction

Colour the part that shows the chance of picking a red counter.

a) Chance of red: $\frac{\quad}{\quad} = \frac{\quad}{\quad}$

b) Chance of red: $\frac{\quad}{\quad} = \frac{\quad}{\quad}$

c) Chance of red: $\frac{\quad}{\quad} = \frac{\quad}{\quad}$

d) Chance of red: $\frac{\quad}{\quad} = \frac{\quad}{\quad}$

2. Fraction of the Total

Look at each group. Write the fraction that shows the chance of the event.

a) Picking a blue counter Fraction: $\frac{\quad}{\quad} = \frac{\quad}{\quad}$

b) Picking a yellow counter Fraction: $\frac{\quad}{\quad} = \frac{\quad}{\quad}$

c) Picking a purple counter Fraction: $\frac{\quad}{\quad} = \frac{\quad}{\quad}$

d) Picking a green counter Fraction: $\frac{\quad}{\quad} = \frac{\quad}{\quad}$

3. Shade the Fraction on the Bar

Shade the fraction to show the chance of the event.

a) Chance of landing on yellow Fraction: $\frac{\quad}{\quad} = \frac{\quad}{\quad}$

b) Chance of landing on blue Fraction: $\frac{\quad}{\quad} = \frac{\quad}{\quad}$

c) Chance of landing on green Fraction: $\frac{\quad}{\quad} = \frac{\quad}{\quad}$

4. Use Simple Fractions to Compare

Look at the pictures. Write $<$, $>$ or $=$ to compare the chances.

a) chance of red $\frac{\quad}{\quad}$ chance of blue $\frac{\quad}{\quad}$

b) chance of green $\frac{\quad}{\quad}$ chance of red $\frac{\quad}{\quad}$

c) chance of purple $\frac{\quad}{\quad}$ chance of blue $\frac{\quad}{\quad}$

d) chance of yellow $\frac{\quad}{\quad}$ chance of green $\frac{\quad}{\quad}$

5. Complete the Table

Look at the picture and complete the table.

Colour	How Many	Fraction of Total
	2	$\frac{2}{8}$
Total	8	$\frac{8}{8}$

7. Make, Record and Describe

Use counters, a spinner or a number cube. Do 8 trials.

Record how many times each outcome happens.

Use a spinner Use a number cube Use counters in a bag

Outcome	Tally	Total	Fraction
Total		8	$\frac{8}{8}$

Which outcome was most likely? _____

Which outcome was least likely? _____

6. Real-Life Chances

Circle the fraction that best describes the chance.

a) Chance of rain today. $\frac{0}{4}$ $\frac{1}{4}$ $\frac{2}{4}$ $\frac{3}{4}$ $\frac{4}{4}$

b) Chance of the sun shining today. $\frac{0}{4}$ $\frac{1}{4}$ $\frac{2}{4}$ $\frac{3}{4}$ $\frac{4}{4}$

c) Chance of getting tails when flipping a coin. $\frac{0}{2}$ $\frac{1}{2}$ $\frac{2}{2}$

d) Chance of rolling a 3 on a number cube. $\frac{0}{6}$ $\frac{1}{6}$ $\frac{2}{6}$ $\frac{3}{6}$ $\frac{4}{6}$ $\frac{5}{6}$ $\frac{6}{6}$

8. Think and Explain

a) Why does a smaller fraction mean the event is less likely?

Why does a larger fraction mean the event is more likely?

Which event has the greatest chance: $\frac{1}{2}$, $\frac{1}{2}$ or $\frac{3}{4}$? Why?

I can...

- ☐ use simple fraction ideas to describe chance.
- ☐ represent chance using fractions.
- ☐ compare chances.
- ☐ explain my thinking.

Chance Words

Great job!

You are using fraction ideas to describe chance like a mathematician!
